

Scheduling Network of Queues: Heavy Traffic Analysis of a Multistation Network with Controllable Inputs (Classic Reprint)

Filesize: 4.09 MB

Reviews

This published publication is fantastic. it had been writtern very perfectly and useful. Once you begin to read the book, it is extremely difficult to leave it before concluding.
(Junius Herman)

SCHEDULING NETWORK OF QUEUES: HEAVY TRAFFIC ANALYSIS OF A MULTISTATION NETWORK WITH CONTROLLABLE INPUTS (CLASSIC REPRINT)

To get **Scheduling Network of Queues: Heavy Traffic Analysis of a Multistation Network with Controllable Inputs (Classic Reprint)** eBook, remember to click the link listed below and download the document or gain access to other information which might be in conjunction with SCHEDULING NETWORK OF QUEUES: HEAVY TRAFFIC ANALYSIS OF A MULTISTATION NETWORK WITH CONTROLLABLE INPUTS (CLASSIC REPRINT) ebook.

Forgotten Books, United States, 2015. Paperback. Book Condition: New. 229 x 152 mm. Language: English . Brand New Book ***** Print on Demand *****.Excerpt from Scheduling Network of Queues: Heavy Traffic Analysis of a Multistation Network With Controllable Inputs Motivated by a factory scheduling problem, we consider the problem of input control (subject to a specified input mix) and priority sequencing in a multistation, multiclass queueing network with general service time distributions and a general routing structure. The objective is to minimize the long-run expected average number of customers in the system subject to a constraint on the long-run expected average output rate. Under balanced heavy loading conditions, this scheduling problem can be approximated by a control problem involving Brownian motion. Linear programming is used to reduce the workload formulation of this control problem to a constrained singular control problem for a multidimensional Brownian motion. The finite difference approximation method is then used to find a linear programming solution to the latter problem. The solution is interpreted in terms of the original queueing system in order to obtain an effective scheduling policy. The priority sequencing policy is based on dynamic reduced costs from a linear program, and the workload regulating input policy releases a customer into the system whenever the workload process enters a particular region. An example is provided that illustrates the procedure and demonstrates its effectiveness. Subject classification: Production/scheduling: priority sequencing in a stochastic job shop. Queues: Brownian models of network scheduling problems. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at This book is a reproduction of an important historical work. Forgotten Books uses state-of-the-art technology to digitally reconstruct the work, preserving the original format whilst repairing imperfections present in the aged copy. In rare cases, an imperfection in...
