

Design and Synthesis of Modified SNARE Proteins with Respect to the α -SNAP/NSF Mediated Disassembly

Filesize: 8.69 MB

Reviews

These sorts of ebook is the best publication accessible. It is amongst the most amazing ebook i actually have read. It is extremely difficult to leave it before concluding, once you begin to read the book.

DESIGN AND SYNTHESIS OF MODIFIED SNARE PROTEINS WITH RESPECT TO THE A-SNAP/NSF MEDIATED DISASSEMBLY

[DOWNLOAD PDF](#)

Cuvillier Verlag Feb 2011, 2011. Taschenbuch. Condition: Neu. Neuware - Soluble N-ethylmaleimide-sensitive attachment receptor (SNARE) proteins are the key players in membrane fusion. Localized in opposed membranes, they assemble via the SNARE motif in a stable four-helix bundle bringing the membranes close to each other and promoting membrane fusion by using the energy release during complex formation. SNARE complex assembly is regulated by several proteins. One of these, Complexin, is known to partially associate with the core complex, it may stabilize SNARE complex intermediates and unbinds upon calcium trigger. Nevertheless, the exact function of Complexin is still under discussion. After membrane fusion the recycling of free SNARE proteins is mediated by the AAA+ protein NSF in conjunction with its cofactor a-SNAP. Afterwards, the individual SNARE proteins are available for another round of membrane fusion. To date, no effective model systems for preventing or at least decelerating the disassembly mechanism are known. Development of a potent inhibitor of the a-SNAP/NSF mediated disassembly was carried out. Therefore, the SNARE motif of Synaptobrevin, one of the SNARE proteins, was used as a model system for the investigation of defined SNARE/SNAP complex recognition sites. The full length of the SNARE motif of Synaptobrevin was obtained using solid phase peptide synthesis. Different modifications at various residues within the sequence were introduced in order to identify important interactions between a-SNAP and the SNARE complex and to prevent a-SNAP recognition. Additionally, the regulator protein Complexin was synthesized as a β -peptide analog, also designed to inhibit the disassembly mechanism by preventing a-SNAP recognition through enhanced interaction between the β -mimic and the Synaptobrevin and Syntaxin helices. By development of the Complexin β -peptide mimic as a 14-helix, the advantages of a well-defined secondary structure with high helix propensity are obtained. Furthermore, the binding fragment of Complexin was performed as...
