Excerpt from Publications of the Yerkes Observatory, Vol. 3: Part I, the Rumford Spectroheliograph of the Yerkes Observatory The application of the-spectroscope in 1868 to the observation of solar prominences in full sunlight opened an extensive field of research, and directed the attention of astronomers to the importance of applying the powerful instruments and. Methods of the physical laboratory to the study of the Sun. Since that time the rise and development of stellar spectroscopy have further emphasized the importance of solar investigation. For it cannot be too often repeated that the Sun is the only star whose phenomena can be studied in detail; in interpreting the Spectroscopic phenomena of all the other stars we must therefore return in every instance to the Sun. If its infinitely varied and complex activities were well understood, the problems encountered in the study of stellar evolution would be greatly Simplified. But although the constant use of the Spectroscope, dating back to the discovery of the chemical Constitution of the Sun in 1859, has furnished an immense amount of valuable information, there appears to be an exceptional opportunity at the present time to secure new and important results, especially through the use of the large spectroscopes and other powerful instruments Of the physical laboratory. For solar spectroscopy has by no means kept pace with laboratory Spectroscopy; few large grating spectroscopes, such as are found in every physical laboratory, have ever been employed to study a large image of the Sun. This being true, it is less remarkable that other laboratory instruments, not so generally available, are still awaiting application in solar research. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books....
