

## Probabilistic Framework for Person Tracking and Classification in Security Assistance Systems

Filesize: 1.13 MB

### ***Reviews***

*This book is great. I have go through and so i am confident that i will going to read through once again again in the future. I am just easily can get a satisfaction of looking at a written book.*

Gca Ges.F.Computeranw. Apr 2013, 2013. Taschenbuch. Book Condition: Neu. 211x146x25 mm. Neuware - In the context of intelligent surveillance of public facilities, the automatic analysis of persons by distributed sensor systems increasingly gains in importance. The detection of hazardous material in busy areas as well as its assignment to a person is a challenging task that cannot be performed without technical decision support. However, the application of conventional technologies and the corresponding courses of action lead to long waiting times and pressure of work for the security personnel. This situation can be extremely relieved by security assistance systems with the ability to analyze an area automatically, based on distributed sensor systems and appropriate data fusion techniques. This thesis makes contributions to the design and the realization of a security assistance system. The system aims at localizing a person with hazardous material in a person stream. To this end, the design stipulates two complementary types of sensors: tracking sensors and sensors to detect hazardous material. While the first type provides location data of high accuracy, but does not have any detection abilities, the second type is able to signalize the presence of a material, but is not able to localize the source. Only within a data fusion approach combining the strengths of the two types of sensor technologies, it is possible to distinguish the carrier of a material from the non-carriers in the person stream. This thesis is particularly focussed on the design of data fusion techniques to realize the described system task. In the context of this task, a probabilistic framework for person tracking and classification in well-defined areas is developed. To realize the tracking component, a novel approach for tracking multiple persons as extended objects is developed. Within this approach ellipsoidal object extents are modeled by random matrices and...
