Excerpt from The Electrical Conductivity of Aqueous Solutions: A Report Presented by Arthur A. Noyes Upon a Series of Experimental Investigations Executed by A. A. Noyes, W. D. Coolidge, A. C. Melcher, H. C. Cooper, Yogoro Kato, R. B. Sosman, G. W. Eastman, C. W. Kanolt, and W. Bottger The investigation to be described in the following series of articles was undertaken for the purpose of studying through a wide range of tempera ture, extending from 18 to the critical temperature and above, the elec trical conductivity of aqueous solutions and such other physical and chem ical properties of them as are related to it or can be determined through measurements of it. Aside from its direct physical significance, it is well known that the electrical conductivity of solutions is a property of funda mental importance in connection with the ionic theory; for it gives the simplest and most direct measure of the ionization of substances, upon which their chemical behavior in solution depends. A full investigation of this property at all temperatures would therefore furnish a comprehensive knowledge of the chemical equilibrium of dissolved substances in water; and if supplemented by determinations of the solubility of solid salts, which determinations can also be made by measuring the conductance of their saturated solutions, a fairly complete basis for the development of the chemistry of aqueous solutions of electrolytes would be obtained.
