

Synopsis of Animal Parasitology (Classic Reprint)

Filesize: 8.36 MB

Reviews

Here is the finest ebook i have got read until now. It really is simplistic but excitement within the 50 percent in the book. Once you begin to read the book, it is extremely difficult to leave it before concluding.

(Lupe Connelly)

SYNOPSIS OF ANIMAL PARASITOLOGY (CLASSIC REPRINT)

Forgotten Books, United States, 2015. Paperback. Book Condition: New. 229 x 152 mm. Language: English . Brand New Book ***** Print on Demand *****.Excerpt from Synopsis of Animal Parasitology Parasitism is a condition of widespread occurrence in both plant and animal kingdoms, though much more characteristic of certain groups than of others. Its basis is to be sought chiefly in a nutritive relation in which one organism, the parasite, obtains its food-supply directly from the living tissues of another organism which in this way becomes the host. In this condition it is purely a matter of the degree of parasitism whether the infesting organism, naturally a smaller species, occupies a superficial position on the body of the host, as an ectoparasite, or as an endoparasite, penetrates into its interior. This parasitic association is one of the results of competition among organisms, and is accompanied by structural changes analogous to those taking place in other directions in free-living organisms by adaptation and specialization. All organisms tend to utilize the available resources of food-supply, but a fundamental difference exists between those possessed of carbohydrate-building power, after the plan of the green plants, and those which, lacking this property, are dependent for their supply of organic food on preformed material. It is the latter group, comprising all animals and many plants, to which the developments of parasitism especially apply; since while the majority of species, the free-living animals, so called, as well as the saprophytes among plants, obtain their food-supply from dead organic material, whatever its original source, many others as parasites form a direct association with the tissues of a living host. The utilization of this source of food-supply and the adaptations produced must accordingly be interpreted in the same manner as for free-living organisms. The evolutionary development of all organisms has...
