Speed and Prime Mover.--The higher the speed of a generator or motor, the more power it can develop, until it reaches the limit of safe or practicable speed. This fact, together with the advantage of high efficiency of the prime mover, is causing turbogenerator sets to be introduced more and more exclusively for all steam-driven A.C. circuits that are of considerable size. The best operating speed of a turbine makes it necessary that the generator have either two or four poles. For 60-cycles, which is the usual frequency, turbo-generators of sizes up to 6,500 kva. usually have two poles, and run at 3,600 r.p.m. Above that capacity, up to 35,000 kva., they have four poles and run at 1,800 r.p.m. Small alternators are still driven by reciprocating engines, in some cases; these and all large and...
