Brand New Book ***** Print on Demand *****.Excerpt from Designing Communcation Networks With Hop Restrictions The topological design of a computer/communication network depends on three main considerations - investment and operating cost, transmission delays, and network reliability. Design models that explicitly account for all three criteria are complex optimization problems that can be solved only by heuristic methods. In this paper, we propose a design model that uses hop constraints to control delays and improve reliability. The hop constraints specify an upper limit on the number of channels over which messages can be transmitted. Reducing the number of hops decreases the average message delay and increases the number of alternate transmission routes; this improvement in network performance is, of course, accompanied by an increase in the total cost of the communication system. To study this tradeoff, we develop a Lagrangian relaxation-based algorithm to identify cost-minimizing network designs that satisfy all internode traffic requirements and hop restrictions. By systematically varying the hop restrictions, this method generates alternative configurations with different cost, delay, and reliability characteristics. Our model, thus, serves as a valuable decision support tool which the network designer can use to assess the cost impact of different performance specifications, and select a design that achieves the proper balance between conflicting objectives. We report results for extensive computational tests of the algorithm using several randomly generated test problems. Our results demonstrate that, even for relatively large problems, the method identifies good heuristic solutions and tight lower bounds that confirm the near-optimality of the selected designs. Using a 25-node example, we illustrate how the model can be used to evaluate the cost versus performance tradeoff. About the Publisher Forgotten Books publishes hundreds of thousands of rare...
