Weak and Electromagnetic Interactions in Nuclei: Proceedings of the International Symposium, Heidelberg, July 15, 1986

Springer. Paperback. Condition: New. 1148 pages. Dimensions: 9.6in. x 6.7in. x 2.2in. Nuclear physics is presently experiencing a thrust towards fundamental physics questions. Low-energy experiments help in testing beyond today's standard models of particle physics. The search for finite neutrino masses and neutrino oscillations, for proton decay, rare and forbidden muon and pion decays, for an electric dipole moment of the neutron denote some of the efforts to test today's theories of grand unification (GUTs, SUSYs, Superstrings, . . .) complementary to the search for new particles and symmetries in high-energy experiments. The close connections between the laws of microphysics, astrophysics and cosmology open further perspectives. This concerns, to mention some of them, properties of exotic nuclei and nuclear matter, and star evolution; the neutrino and the dark matter in the universe; relations between grand unification and evolution of the early universe. The International Symposium on Weak and Electromagnetic Interactions in Nuclei (W. E. LN. 1986) held in Heidelberg 1-5 July 1986, in conjunction with the 600th anniversary of the University of Heidelberg, brought together experts in the fields of nuclear and particle physics, astrophysics and cosmology.
