Does the Earth contain enough oil to provide energy for the human race indefinitely? If not, how long will the oil last? What about renewable energy technologies like wind and solar? Will they be able to supply an indefinite supply of energy for the human race? If not, how long will it last? And what role does overpopulation play in our world s energy supply? Even with multiple forms of energy available, how long will it last as long as more and more humans, and therefore more industries and energy consumption, are added? Taking a long-held theory called Peak Oil Theory the authors of this groundbreaking new text examine the theory of Peak Energy to examine all of these questions. Crude oil and natural gas are the major sources of fuel used to supply energy for various needs. Users of crude oil and natural gas must take into account that these energy sources are, without doubt, non-renewable depleting resources, and the cost of extraction depends not only on the current rate of production but also on the amount of cumulative production. In fact, many pundits believe projections that the world is rapidly apprpaching a precipice, after which crude oil and natural gas will no longer be in ready supply. This phenomenon has given rise to the peak oil theory - peak oil is the point in time when the maximum rate of petroleum recovery from the reservoir is reached, after which the rate of petroleum production enters terminal decline. From this concept has emerged the wider concept of the peak energy theory which, as it is related to the availability of all fossil fuels, is also subject to decline...
