Excerpt: . . . is dissolved in the acid intestinal juice and in case of the development of ammoniacal compounds unites with the ammonia to form the almost insoluble triple Fig. 40. Half of a fractured lamellated enterolith from a horse. phosphate. The marked sluggishness of peristalsis which obtains with this diet, and ammoniacal fermentation of the intestinal contents by bacteria, aid in the formation of the calculi. Usually the larger examples are single; but of the smaller sizes there may be dozens or hundreds in one intestine. In addition to pressure erosions caused in the mucous membrane by these calculi, they may produce fatal results, especially by accidental impaction and obstruction at some narrow part of the intestinal tube. (For details cf. Spezielle pathol. Anatomie d. Haustiere, II. Aufl. 1902, Stuttgart, Enkes Verlag. ) Horses which take in sand and mud in drinking from pools (and the...
