Not illustrated. 1907 Excerpt: . . . suggests a method of finding the tangent to any curve represented by an equation of the second degree, the slope of the tangent being given. For if m of the required tangent is known, its equation may be written $y = mx + b$, where b is not known. According to the definition of a tangent, however, b must have such value that the points of intersection of straight line and curve shall be coincident. This condition enables us to determine b , as shown in the following examples. Ex. 1. Find the equation of the tangent to the parabola $y^2 = 4ax$, the slope of the tangent being 2. Since the slope of the tangent is 2, its equation may be written $y = 2x + b$. Substituting this value of y in the equation of the parabola, we have the equation $(2x + b)^2 = 4ax$. Since the...
