Filesize: 4 MB

Reviews

This type of publication is every thing and helped me seeking ahead and much more. It usually fails to charge too much. It is extremely difficult to leave it before concluding, once you begin to read the book.

(Juliet Mertz)

EMBEDDED LINUX SYSTEMS WITH THE YOCTO PROJECT (PRENTICE HALL OPEN SOURCE SOFTWARE DEVELOPMENT SERIES)

Prentice Hall. Paperback. Condition: New. 500 pages. As embedded systems grow more complex, developers are integrating full-fledged operating systems into them. Linux is an especially attractive option: it supports virtually all hardware architectures and many peripherals, scales well, offers full source code, and requires no royalty payments. However, building custom versions of Linux for new embedded systems has traditionally been difficult. The Yocto Project simplifies and streamlines every step of the process -- and this expert primer will help you make the most of it. An indispensable companion to the official documentation, it offers in the trenches insights you won't find anywhere else. Leading embedded systems developer Rudolf Streif gives you a solid grounding in the basics, then guides you through more advanced topics -- ranging from building board support packages to managing compliance. You'll master the Yocto Project toolbox by working through the entire development lifecycle on a realistic project: a distributed home automation system consisting of multiple embedded devices with diverse functionality, all communicating via networking infrastructure. As you use Poky and the OpenEmbedded Core metadata layer to create a custom embedded Linux distribution, you'll master all this, and more: Setting up your build environment Using Application Development Toolkit (ADT) to integrate with the powerful Eclipse development workbench Utilizing the Poky Build System and its HOB graphical frontend Laying out system components, including structure, directories, and files Using Bitbake Task Executor and its recipes to build entire Linux distros, including toolchains Running basic builds for emulated targets Customizing Linux systems, adding packages, configuring kernels, and developing board support packages (BSP) Including your own software packages with image targets Maintaining a common software base while supporting different CPU architectures and hardware configurations Managing licensing and compliance, including tracking licenses, filtering non-conformant licenses, and enabling commercial code This item ships...
