Pearson Education (US), United States, 1997. Hardback. Book Condition: New. 4th Revised edition. 246 x 190 mm. Language: English . Brand New Book. Differential equations are of fundamental importance in the applications of mathematics to the physical and biological sciences. This text provides an elementary but cohesive development of the topic. The primary goal of the book is to teach students how to use differential equations in applied areas. To this end, the book includes more than 400 worked examples and 2500 exercises, chapter summaries that include a review of the important concepts, chapter review exercises, self-quiz problems, numerous applications in various fields, a section in each chapter on solving problems using symbolic manipulators such as Mathematica, MAPLE, and DERIVE, and a manual for such solutions. *The First Chapter is motivated by first order linear methods. *Separation of Variables discussion has been moved from Chapter 1 to 2. *Early Introduction to Numerical Methods - Euler's method is discussed in Section 1.4, giving the student an early look at approximation followed by a thorough treatment of this topic in Chapter 8. *This edition has a great deal of coverage and attention to computer algebra systems and how they can be used in differential equations to help solve problems. Generic CAS code is found at the ends of many chapters along with a manual providing specific Mathematica, Maple, and Derive coverage. *Self-tests, chapter summaries, and titled examples. *Three sections of the book, 1.1, 2.3, and 4.3 are devoted to mathematical modeling where students are asked to question the reasonableness of models. *More illustrations, many of which are graphs of solutions to examples. *Outstanding Applications - diverse, interesting, and referenced. Theory is secondary to the goal of applying the mathematics to problems that students who take the course will be solving. *Historical Notes and biographical sketches of some of the mathematicians who...
