The siphon recorder in Canso was adjusted in its normal working condition and not changed throughout the experiment. Volts constant, frequency and amplitude variable.--A sim 16 6 10 16 20 25 30 VOLTS IMPRESSED AT NEW YORK Fiu. 8.--Relation between the impressed volts and the double amplitude of the received recorder. (1) Frequency equals 3.05, (2) 4.70, (3) 5.60. C. I. cable simplex without condenser at transmitting end, and regular duplex with 60 microfarad condensers at receiving end. pie alternating current, having an electromotive force wave like that in Fig. 5, was sent into the cable at constant voltage, and the frequency alone varied between the limits 3 and 6.4 waves per second. The record upon the Canso recorder showed a smooth wave approximating a sine wave, and the amplitudes of these waves were measured for the different frequencies, giving the result exhibited in Fig. 7. It is seen that the observed points lie within the limits of error almost upon a line whose equation is $2a = -2.97n + 20.64$ Fio. 9.--Helation between frequency and double amplitude of the receiving recorder for 30,20,10 and 5 volts. Circuits the same as in Fig. 7. where a is the amplitude of the recorder and n the frequency. The pressure was constant throughout at 30 virtual volts. As the frequency increases the amplitude of the distant...
