Then the cases of *Ascaris*, *Helix* and *Strongylocentrotus* where the number of chromosomes is either n or $2n$ are curious, but they do not speak for a condition of fluctuating variation, and may be more readily explained as an additional division of all the elements. come to behave differently from those of the germ cells and even perhaps come to lose their individuality. Change in chromosomal number and behavior might be a regular concomitant of somatic differentiation, quite exclusive of any process of chromatin diminution. This is only a tentative hypothesis, but it may open up a new path in the investigation of the chromosomes. Whatever conclusions be reached for the tissue cells, however, need not in any way invalidate the theory of the continuity of the chromosomes as applied to the germ cells. On the whole, accordingly, Della Valles view of the lability of the chromatin cannot be said to be substantiated by him, for his new evidence is open to criticism on account of his material being unfavorable; his thesis that constancy in number of chromosomes is essential for the theory of the individuality of the chromosomes is not correct; many of the cases he adduces from the literature are not admissible because they are more readily explained in other ways; and he evades much of the evidence that speaks most strongly for the idea of...
