Forgotten Books. Paperback. Condition: New. This item is printed on demand. 58 pages. Dimensions: 9.0in. x 6.0in. x 0.1in. Excerpt from American Cinematographer, Vol. 11: A Technical and Educational Publication, Espousing Progress and Art in Motion Picture Photography; May, 1930 In the early models of the B. 8 H. Printer, the printing light was controlled through the mobility of the jaws of the printing aperture. By enlarging or reducing the printing aperture more or less exposure was given the positive film for a uniform running speed of the machine. A refinement developed a few years ago added a new method of light control called the back shutter, which, as its name implies, consists of a variable aperture shutter located at an approximately mid-distance between the printing light and the aperture. The versatility of this method of light control is so great that it permitted to dispense with the varying in width of the printing aperture itself while retaining a great range of light intensities easily controlled from the outside of the apparatus. The back shutter proved invaluable in the development of the triple adjustment sound attachment. Because it permitted to stabilize the printing aperture to a standard 5-16 dimension which is also the height dimension of the triple matts. The back shutter method of light control is applied to the independent printing of both the picture or the sound record, as the occasion arises. Now let us turn for a moment to a consideration of the actual manner in which the three masks are arranged so as to control the final result in the print. At Fig. 3 is shown the complete unit so that its action can be more clearly visualized. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books.
