Under the influence of declining birth rates, expanding longevity, and changing population structures around the world, the global prevalence of senile dementia is expected to increase more than four-fold within the next forty years. Within the United States alone, the number of affected individuals over the age of 65 is expected to rise exponentially from 8 million cases (2 of the entire population in the year 2000), to 18 million retirees (roughly 4.5 of the national census in the year 2040).
