

Salivary transcript expression profiles of Phlebotomus papatasi

By Nasibeh Hosseini-Vasoukolaei

LAP Lambert Academic Publishing Jul 2016, 2016. Taschenbuch. Book Condition: Neu. 220x150x7 mm. Neuware - Zoonotic cutaneous leishmaniasis is a neglected tropical disease of public health importance in many rural areas of Iran. Saliva of phlebotomines consists of different molecules that are necessary for a sand fly to successfully take a blood meal. Additionally, previous exposure to sand fly saliva indirectly affects the establishment of Leishmania in vertebrate hosts. Sand fly saliva has immunomodulatory characteristics and induces a specific immunity consisting of antibody production and a cellular immune response. In this study we defined salivary gland proteins of wild population of Phlebotomus papatasi with various physiological characteristics at different seasons, and also the immune response of Rhombomys opimus reservoir host to different salivary antigens, to understand the natural interaction between vector, host and parasite in the study area. We also analyzed the effect of physiological and seasonal characteristics on the expression profile of sand fly salivary genes. We hope the findings of this study could be helpful in the designing of saliva-based vaccine to control the disease. 120 pp. Englisch.
