If incident at an early age the displacement of the mediastinal organs may become extreme; nevertheless, life may be prolonged, even under these conditions of severe cardiovascular strain, for several years (vide Radiograms 63A and B). 1. Phthisis fibro-disseminata is generally bilateral, and often appears to be the direct result of fibrosis following subacute types of the same name (Chap. III). When it is bilateral, it is usually accompanied by double emphysema, which throws into bold relief the opaque foci when viewed on the fluoroscopic screen. The picture becomes even more striking after an attack of asthma, a complication which is frequent in these individuals as they advance in years. (a) Archibald E, aet. 28 (26.2.18). Clinical: has been in the army since boyhood: cough +...
