Excerpt: .chloride (Hg2Cl2) is only slightly soluble (0.002 g/1 (gram per liter) or 2,000 ppb). It has a strong tendency to dismutate according to the reaction Hg2+2--Hg--Hg+2 under aqueous conditions (Sidgwick, 1950, p. 294). This reaction may be promoted by ultraviolet radiation (Sidgwick, 1950, p. 295). James (1962) sug Incorrectly cited by Rankama and Sahama (1950. p. 718) as 2 ppb. gested that the rather insoluble basic sulfate salt Hg2S04 HgO H20 is also likely to form as the result of oxidation of mercury-bearing sulfide ores. Mercuric chloride, HgCl, being highly soluble (69 g/1 at 25C), will be readily leached by rainfall and carried to streams by runoff, underflow, or ground water discharge. Rainfall-induced erosion and leaching also convey a part of the atmospheric mercury, previously returned to the land surface, to streams and other waters. Of course, a part of the atmospheric mercury is returned directly to...
